

The MovieDB App

Summary

Showcase your skills and create an app that uses themoviedb API to display items of popular movies.

Setup

Create a private repository in Github and share it with us when ready (user “gnou” and “matijag1” on GitHub). Get an API key for the TheMovieDB API

<https://developers.themoviedb.org/> or [https:// www.themoviedb.org/](https://www.themoviedb.org/)

Specification

The app should consist of the two screens:

1. A list of popular movies with title and image.
2. Details of a certain item of movie.

What details to display is up to you (for instance: movie title, overview, poster etc.) For senior level position, the following are must-haves:

- An architecture setup, for example MVVM/MVI/MVP
- Persist data locally
- Scroll to load more

Optional:

- Error handling
- Unit testing **Review**

We'll evaluate your code based on your architectural decisions and code quality. We'll also check the app's **performance**, **stability**, and the **readability** of your codebase.
